PHASE 01 / PROJECT DOCUMENTATION

Ideation Phase

Discovering the opportunity and defining the project direction.

The project explores how electric-vehicle market data can be turned into useful, understandable information for strategy, business intelligence, and sustainable-mobility research.

01 | The opportunity

Electric vehicles are expanding across multiple categories, while manufacturers differentiate themselves through pricing, battery technology, driving range, performance, and customer experience. The information needed to compare these dimensions may be spread across multiple fields and records. This project proposes a structured, visual way to explore the available EV dataset and help users ask better business questions.

02 | Problem statement

Users need a reliable way to examine the selected EV dataset without manually scanning rows or repeatedly building separate summaries. The challenge is to organize the available information into a coherent analytical experience that makes comparisons easier, reveals patterns worth investigating, and communicates limitations clearly. The dashboard should support evidence-based decisions rather than claim to represent the entire market unless the data supports that scope.

03 | Stakeholder empathy

MARKET STRATEGY

Needs a concise view of manufacturer and vehicle-category performance to guide portfolio and market decisions.

BUSINESS INTELLIGENCE

Needs comparable measures and filters to prepare clear, data-backed recommendations.

RESEARCH & POLICY

Needs transparent comparisons of battery technologies, range, geography, and adoption-related indicators.

COMMON EXPECTATION

Clear definitions, dependable calculations, readable visuals, and visibility into the dataset's coverage and gaps.

04 | Questions that shape the idea

- Which vehicle categories account for the largest share of recorded sales, if sales data is available?
- How do manufacturers compare within the selected dataset and time period?
- What battery technologies appear in the data, and how do their recorded specifications differ?
- How does driving range vary across vehicle categories or battery types?
- What geographic patterns are visible in manufacturing-country records?
- How do customer ratings differ by manufacturer or category, if ratings are included?

05 | Initial solution concept

ONE CONNECTED VIEW

Bring key indicators and comparison charts into one dashboard instead of disconnected manual reports.

INTERACTIVE EXPLORATION

Allow users to narrow the analysis by supported fields such as year, manufacturer, category, battery type, or country.

STORY-LED ANALYSIS

Arrange views in a sequence: market overview, manufacturer/category comparison, technology, geography, and customer response.

RESPONSIBLE INTERPRETATION

Show data source, units, definitions, missingness, and limitations alongside findings.

06 | Success indicators

Indicator	What success looks like
Clarity	A first-time user can explain the purpose of each main view.
Traceability	Displayed KPIs can be checked against documented calculations.
Usefulness	Each chart answers a defined stakeholder question.
Trust	Data source, scope, units, and known gaps are easy to find.

Phase output

A documented problem statement, stakeholder needs, initial analytical questions, and a focused dashboard concept. Dataset-specific claims and numeric findings are intentionally deferred until the source data has been validated.
